

## Transforming how data is classified with IBM Granite models

Arun and Anna work as customer support agents at an insurance company.

Over the past year, the company has grown rapidly, leading to an increase in customer inquiries and support tickets.

To keep up with this growth, Arun and Anna need to manage hundreds of tickets every day. Each ticket covers various issues, from claims and policies to payments. They need to manually review, categorize, and assign each ticket to the right team for resolution, a process that is time-consuming and inefficient.

With the increasing volume of tickets, Arun and Anna find themselves spending more time on repetitive tasks and less time resolving customer issues, causing delays in response times and reduced customer satisfaction.

Determined to find a solution, Arun and Anna start researching ways to improve their ticket management process.

That's when one of their colleagues recommends that they explore IBM Granite models.

IBM Granite models are a family of advanced large language models designed to make generative AI practical for real-world applications.

These models specialize in tasks such as text classification, which involves organizing text-based data by classifying it into specific categories.

This makes them ideal for managing the growing volume of support tickets.

IBM Granite models enable Arun and Anna to automatically categorize incoming tickets into categories such as "claims" and "policies". This eliminates the need for manual categorization, speeding up ticket processing and ensuring inquiries are assigned to the right team.

When they start using IBM Granite models, Arun and Anna immediately experience positive results: ticket processing is faster, response times decrease, and customer satisfaction improves.

Now, Arun and Anna can focus on solving customer problems rather than spending hours categorizing tickets.

For businesses managing large volumes of data, IBM Granite models are essential tools for simplifying and automating classification tasks, improving efficiency, and delivering better outcomes.
